Daily You - Mood Tracker + Dairy Thoughtful UI

Introduction

The Daily You – Mood Tracker & Diary mobile application helps users record their daily emotions and thoughts. Many people experience different feelings every day but do not track them. This application allows users to select their mood and write a short diary entry. Over time, the user can see their emotional patterns and reflect on their daily experiences.

Step By Step Procedure :

Step 1 – Start the Application : The user opens the Daily You – Mood Tracker application on their mobile device. After opening the application, the system loads the main interface.

Step 2 – Display Home Screen : The application displays the home screen. The home screen shows different mood options such as Happy, Sad, Angry, Neutral and Excited.

Step 3 – Select Mood : The user selects the mood that best represents how they feel on that day. This helps the system understand the user's emotional condition.

Step 4 – Open Diary Entry Screen : After selecting the mood, the application moves to the diary entry screen where the user can write about their day.

Step 5 – Write Diary Entry : The user writes a short note about their day. The note may include their experiences, feelings, or important events that happened during the day.

Step 6 – Save the Entry : After writing the diary note, the user clicks the save button.

Step 7 – Collect Data : The application collects the selected mood, the diary text written by the user, and the current date and time.

Step 8 – Store Data : The system saves this information in a local database so that the data can be accessed later.

Step 9 – View History : The user can open the history section to view previously saved mood entries and diary notes.

Step 10 – Display Records : The application retrieves stored information from the database and displays it in an organized list.

Step 11 – End Process : The process repeats whenever the user records a new mood and diary entry

Logic or Method Used :

Overview

The Daily You Mood Tracker & Diary application works based on a simple logic that combines user input, data storage, and data retrieval. The main idea of the system is to allow users to record their daily mood and thoughts so that they can review them later.

Method Used in the System :

First, the user interacts with the application through a simple user interface. The home screen provides mood icons that represent different emotions. The user selects the mood that matches their current feeling.

Once the mood is selected, the system redirects the user to the diary entry page. On this page, the user can write their thoughts, experiences, or feelings about the day. This diary entry allows the user to record personal reflections in a digital format.

After writing the diary entry, the user presses the save button. The application then collects three important pieces of information:

- Selected mood
- Diary text
- Current date and time

The system processes this information and stores it in a local database. The database keeps all entries safely stored on the user's device.

Later, when the user opens the history page, the application retrieves previously saved data from the database. These entries are displayed in a list so the user can easily review past moods and diary notes.

This method helps users track their emotions over time and understand their daily emotional patterns..

Model or Technique Applied

Development Model

The Daily You Mood Tracker & Diary project uses a mobile application development model based on modern mobile technologies. The application is developed using the **Flutter framework and the Dart programming language. These technologies allow developers to create attractive and responsive mobile applications.

Technique Used in the System

1. **User Interface Design :** The application uses a thoughtful user interface design technique. The interface is simple, clean, and easy to use. Mood icons are clearly visible so users can select their feelings quickly.

2.Data Storage Technique : The application uses a local database storage technique. This means all mood records and diary entries are stored inside the mobile device. A lightweight database system such as SQLite is used for storing data.

3. Data Retrieval Technique : When users want to see their past entries, the system retrieves stored information from the database and displays it on the history screen.

4. User Interaction Technique : The application follows a user-centered interaction approach where users interact with buttons, icons, and text fields to enter information.

These techniques make the application simple, efficient, and user-friendly.

Process Flow of the System

System Overview

The process flow describes how the application works from the moment the user opens the app until the diary entry is saved and displayed in the history section.

Process Flow Explanation :

First, the user opens the application on their mobile device. The system loads the home screen where mood options are displayed. The user selects the mood that represents their emotional state.

After selecting the mood, the system navigates to the diary entry screen. On this screen, the user writes a short diary note describing their day or feelings.

Once the diary entry is completed, the user presses the save button. The system processes the data and stores it in the database along with the date.

Later, if the user wants to check previous entries, they can open the history section. The system retrieves stored data and displays it in an organized format.

Dataset of the Project

Overview

The dataset for the Daily You Mood Tracker & Diary project consists of user-generated mood entries and diary notes. The dataset represents the information recorded by users during daily use of the application.

Each entry in the dataset contains information about the user's mood, diary text, and the date of the entry.

Purpose of the Dataset

- The dataset helps the application to:
- Store daily mood records
- Maintain diary entries
- Allow users to review past emotional experiences
- Identify emotional patterns over time

By analyzing this stored data, users can better understand their emotional health and daily life experiences.
